PERFORMANCE SNAPSHOT

Why Traffic Is Low Right Now — and the Plan to Fix It

Prepared for the client of Web Digital Development. This report explains, in plain language, the current search performance of the website, the real reasons organic traffic is still low, what has already been built, and a clear 90-day plan to grow traffic.

Executive summary

The website is **live, technically healthy, and already ranking on Google for the right keywords** (web design / development in Delhi, NCR, Ghaziabad, Faridabad). The issue is **where** it ranks: almost every keyword currently sits on **pages 4–8 of Google**. Since users rarely go past page 1, rankings that deep bring close to zero clicks — which is exactly what the analytics show.

This is **normal and expected** for a site at this stage. It is **not** a tracking error and **not** a broken website. The site simply needs **authority (quality backlinks), a Google Business Profile, and consistent content** to climb from page 5 toward page 1 — a 3–6 month compounding effort.

9	6/100	28	0
Active users (last 28 days)	Semrush Authority Score	Keywords ranking on Google	Keywords in Google Top 10

1. Where things stand today

Two independent tools tell the same story.

Metric	Value	What it means
Active users — GA4 (28 days)	9 (4 new)	Very few real visitors; a few of these are bots / referral spam (Sweden, Japan, US).
Traffic sources	3 Google, 6 direct/social	Only 3 visits came from Google search in 28 days.
Keywords ranking (Semrush)	28	Site is indexed and ranks for relevant local terms.
Keywords in Top 10 / Top 30	0 / 0	Nothing is on page 1–3 yet, so almost no clicks.
Authority Score	6 / 100	Low domain authority — the main thing holding rankings down.
Backlinks / referring domains	223 / 122	A starting link profile; needs more quality, relevant links.
Est. monthly organic traffic	~19 visits	Direct result of ranking on page 4–8 instead of page 1.

2. The real problem: right keywords, wrong page

The site already ranks for keywords that can bring real customers — but on deep pages. Over 90% of clicks go to page 1. Here are live examples (Semrush, India):

Keyword	Monthly searches	Current position	Google page
web development company in delhi	1,600	73	Page 8
web development company in delhi ncr	720	58	Page 6

website designing company in faridabad	480	72	Page 8
web development services in delhi	390	77	Page 8
web designing company in ghaziabad	210	62	Page 7
website design ghaziabad	210	53	Page 6
list your website on google (blog)	110	44	Page 5

Good news: the keyword difficulty for most of these local terms is low-to-moderate, so reaching page 1 is realistic within a few months of focused work — the rankings just need a push.

3. Why the rankings haven't reached page 1 yet

- **The site is still young.** Google takes 3–6 months to trust a new domain before it ranks it on page 1 for competitive terms.
- **Low domain authority (score 6/100).** Competing Delhi/NCR agencies have far more quality backlinks. Authority is the single biggest lever to climb.
- **No Google Business Profile yet.** This means the site is completely missing the Google Map pack and "web design near me / in Delhi" local results — the biggest quick-win for a local business.
- **Highly competitive niche.** "Website design company in Delhi" is contested by established agencies who have ranked for years.
- **Content & promotion not yet consistent.** Regular blogs and off-page promotion create the entry points and signals Google rewards.

Important: This is NOT a tracking bug and NOT a broken site. The website is indexed, fast, mobile-friendly and already ranking — it just needs authority + local presence to move up.

4. What has already been built (the foundation)

This groundwork is what makes ranking possible in the first place — it is done and working:

- Fast, mobile-responsive website with clean modern design
- On-page SEO: optimized titles, meta descriptions and headings across pages
- Structured data / schema markup (business, services, articles, FAQs, breadcrumbs)
- XML sitemap + Google indexing; location pages for Delhi, NCR, Ghaziabad, Faridabad
- Blog engine with SEO-optimized articles and internal linking
- Performance, accessibility and technical-SEO fixes (Core Web Vitals)

5. The 90-day plan to grow traffic

Days 0–30 — Foundation & local presence

- Set up & verify **Google Business Profile** (Delhi) — category, services, photos, hours, posts. This alone can start bringing local calls.
- Connect & verify **Google Search Console** + Bing Webmaster; submit sitemap; fix any indexing gaps.
- Build 8–10 core local citations & directory listings (Justdial, Sulekha, IndiaMART, Google Maps, social profiles) with consistent name/address/phone.

Days 30–60 — Authority & on-page strength

- Start **quality backlink building**: guest posts, niche/business directories, local partnerships — to lift the authority score.
- Strengthen the top target pages (Delhi, Delhi NCR, Ghaziabad, Faridabad) with deeper, keyword-focused content, internal links and client testimonials.
- Publish 2–4 SEO blogs targeting low-difficulty, high-intent keywords to open new entry points.

Days 60–90 — Momentum & reviews

- Continue consistent link building and a weekly content cadence.
- Collect **Google reviews** on the Business Profile — strong signal for local ranking and trust.
- Track movement in Search Console; prioritize keywords climbing from page 4–5 toward page 2–3 and push them to page 1.

What to expect: Local calls from Google Business Profile can begin within weeks. Organic rankings are a 3–6 month compounding investment — expect target keywords to climb from page 4–8 toward page 1–2 over the quarter, with traffic compounding after. For **immediate leads**, a small Google Ads / Meta Ads budget can run in parallel while SEO matures.

6. How we measure progress

We report transparently from the same tools used in this document:

- **Google Search Console** — the source of truth for search: impressions, clicks, keywords, positions and indexing.
- **Google Analytics 4** — visitors, sources and on-site behavior.
- **Semrush** — keyword rankings, authority score, backlinks and competitor benchmarking.
- **PageSpeed Insights** — site speed and Core Web Vitals.

We recommend a **monthly performance report** so progress on rankings, traffic and leads is visible and measurable throughout the campaign.
